Student Rank System Program

Aim: To create a Python program that processes students' marks, determines individual grades, identifies the highest score, calculates the class average, and classifies the overall performance of the class.

Error code:

```
print("Student Rank System")
students = int(input("Enter student count: "))
i = 0
highest = 0
total = 0
while i < students:
marks = int(input("Enter marks: "))
total = total + marks
if marks > highest:
highest = marks
if marks >= 90:
print("Grade A")
elif marks >= 75:
print("Grade B")
elif marks >= 50:
print("Grade C")
else
print("Fail")
i = i + 1
average = total / students
print("Highest:", highest)
print("Average:", average
if average > 80:
```

print("Top Class")

else:

print("Normal Class")

Output:

List of errors:

- **Indentation error** – The statements inside the while loop are not indented properly.
- **Indentation error** – The statements inside the if, elif, and else blocks are not indented.
- **Missing colon (:)** – The else statement does not have a colon.
- **Missing closing parenthesis** – The statement print ("Average:", average is missing a closing bracket).
- **Improper block structure** – Because of incorrect indentation, the loop and conditional blocks are not properly defined.

Correct code:

```
print("Student Rank System")

students = int(input("Enter student count: "))
i = 0
highest = 0
total = 0

while i < students:
    marks = int(input("Enter marks: "))
    total = total + marks

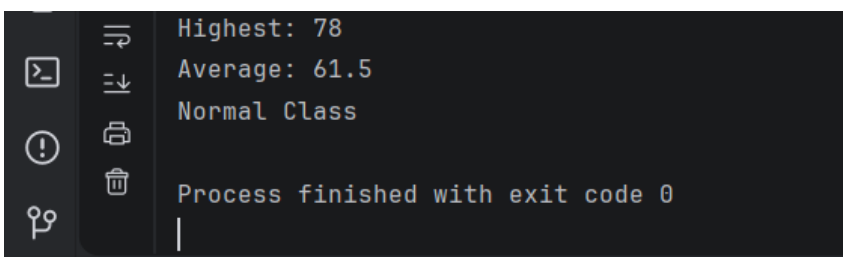
    if marks > highest:
        highest = marks

    if marks >= 90:
        print("Grade A")
    elif marks >= 75:
        print("Grade B")
    elif marks >= 50:
        print("Grade C")
    else:
        print("Fail")

    i = i + 1

average = total / students
```

```
print("Highest:", highest)
print("Average:", average)

if average > 80:
    print("Top Class")
else:
    print("Normal Class")
```


Output:
